Evolution of Harmonic Drive® Gear Revolution

Harmonic Drive® precision gear continues to evolve by improving performance and functionality.

System Components

The FLEXSPLINE is a non-rigid, steel cylindrical cup with external teeth on a slightly smaller pitch diameter than the Circular Spline. It fits over and is held in an elliptical shape by the Wave Generator.

The WAVE GENERATOR is a thin raced ball bearing fitted onto an elliptical plug serving as a high efficiency torque converter.

The CIRCULAR SPLINE is a rigid ring with internal teeth, engaging the teeth of the Flexspline across the major axis of the Wave Generator.

Driving Configurations

Driving Configurations

A variety of different driving configurations are possible, as shown below. The reduction ratio R, given in the tables on page 7 and 8 correspond to arrangement 1, in which the Wave Generator acts as the input element, the Circular Spline is fixed and the Flexspline acts as the output element.

$$\text{Ratio} = \frac{\text{input speed}}{\text{output speed}}$$

Definition of Ratings

Rated Torque (Tr)

Rated torque indicates allowable continuous load torque at 2000 rpm input speed.

Limit for Repeated Peak Torque (refer to figure 1)

During acceleration a deceleration the Harmonic Drive® gear experiences a peak torque as a result of the moment of inertia of the output load. The table indicates the limit for repeated peak torque.

Limit for Average Torque

In cases where load torque and input speed vary, it is necessary to calculate an average value of load torque. The table indicates the limit for average torque. The average torque calculated must not exceed this limit.

Limit for Momentary Peak Torque (refer to figure 1)

The gear may be subjected to momentary peak torques in the event of a collision or emergency stop. The magnitude and frequency of occurrence of such peak torques must be kept to a minimum and they should, under no circumstance, occur during normal operating cycle. The allowable number of occurrences of the momentary peak torque may be calculated by using equation 1. Also see section "strength and life".

Figure 1

Maximum Input Speed, Limit for average input speed

Do not exceed the allowable rating.

Moment of Inertia

The rating indicates the moment of inertia reflected to the wave generator (gear input).

Strength and Life

The non-rigid Flexspline is subjected to repeated deflections, and its strength determines the torque capacity of the Harmonic Drive® gear. The values given for Rated Torque at Rated Speed and for the allowable Repeated Peak Torque are based on an infinite fatigue life for the Flexspline.

The torque that occurs during a collision must be below the momentary peak torque (impact torque). The maximum number of occurrences is given by the equation below.

[Equation 1]

$$N = \frac{1.0 \times 10^4}{2 \times \frac{n}{60} \times t}$$

n: Input speed before collision
t: Time interval during collision

Please note:

If this number is exceeded, the Flexspline may experience a fatigue failure.

Ratcheting phenomenon

When excessive torque is applied while the gear is in motion, the teeth between the Circular Spline and Flexspline may not engage properly. This phenomenon is called ratcheting and the torque at which this occurs is called ratcheting torque. Ratcheting may cause the Flexspline to become non-concentric with the Circular Spline. (See figure 1 & 2 on page 12) Operating in this condition may result in shortened life and a Flexspline fatigue failure.

Figure 2

Note!

When ratcheting occurs, the teeth mesh abnormally as shown above. Vibration and Flexspline damage may occur. Once ratcheting occurs, the teeth wear excessively and the ratcheting torque may be lowered.

The Life of a Wave Generator

The normal life of a gear is determined by the life of the wave generator bearing. The life may be calculated by using the input speed and the output load torque.

Rated Lifetime L_n : ($n = 10$ or 50) , hours

L_{10} CSD,SHD: 7,000

L_{50} CSD,SHD: 35,000

Equation for the expected life of the wave generator under normal operating conditions is given by the equation below.

[Equation 2]

$$L_h = L_n \cdot \left(\frac{T_r}{T_{av}} \right)^3 \cdot \left(\frac{N_r}{N_{av}} \right)$$

L_h : Expected Life, hours

L_n : Rated Lifetime at L_{10} or L_{50} , hours

T_r : Rated Torque (Tables 1, 2, 3)

N_r : Rated input speed (2000 rpm)

T_{av} : Average load torque on output side (page 14)

N_{av} : Average input speed (page 14)

Relative Torque Rating

The chart below shows the various torque specifications relative to rated torque. Rated Torque has been normalized to 1 for comparison.

Figure 3

Size Selection

Generally, the operating conditions consist of fluctuating torques and output speeds. Also, an unexpected impact output torque must be considered.

The proper size can be determined by converting fluctuating load torque into average load torque and equivalent load torque. This procedure involves selecting the size based on load torque for component sets.

This procedure does not consider the life of the output bearing for housed units. Determining the life of the output bearing for various axial, radial, and moment loads is outlined on page 25.

Figure 4

Parameters

Load Torque	T_s (Nm)
Time	t_s (sec)
Output Speed	n_s (rpm)

Normal Operating Pattern

Acceleration	$T_1 \cdot t_1 \cdot n_1$

Max input speed	n_i maximum

Impact Torque	$T_s \cdot t_s \cdot n_s$
---------------	---------------------------

Ratings

Rated Torque	T_r
Rated Speed	$n_r = 2000$ rpm

Flow Chart for selecting a size

Please use the flowchart shown below for selecting a size. Operating conditions must not exceed the performance ratings as described on page 12.

Calculation of the average output torque

$$T_{av} = 3 \sqrt{\frac{n_1 \cdot t_1 \cdot |T_1|^3 + n_2 \cdot t_2 \cdot |T_2|^3 + \dots + n_n \cdot t_n \cdot |T_n|^3}{n_1 \cdot t_1 + n_2 \cdot t_2 + \dots + n_n \cdot t_n}}$$

Selection of tentative size under the condition shown below.

Average Output Speed

$$n_o \text{ av} = \frac{n_1 \cdot t_1 + n_2 \cdot t_2 + \dots + n_n \cdot t_n}{t_1 + t_2 + \dots + t_n}$$

Determine Gear Ratio

$$\frac{n_i \text{ max}}{n_o \text{ max}} \leq R$$

n_i max may be limited by the motor.

Calculation of the average input speed

$$n_i \text{ av} = n_o \text{ av} \cdot R$$

Calculation of maximum input speed

$$n_i \text{ max} = n_o \text{ max} \cdot R$$

NG

$n_i \text{ av} \leq$ Limit for average speed
 $n_i \text{ max} \leq$ Limit for maximum speed

OK

NG

Confirm if T_1 and T_3 are less than the repeated peak torque specification.

OK

NG

Confirm if T_s (impact torque) is less than the momentary peak torque specification.

OK

NG

Calculate the allowable number of rotations during impact torque.

$$N_s = \frac{10^4}{2 \cdot \frac{n_s \cdot R}{60} \cdot t_s} \dots \dots N_s \leq 1.0 \times 10^4$$

OK

Calculate wave generator life.

$$L_w = L_n \cdot \left(\frac{T_r}{T_{av}} \right)^3 \cdot \left(\frac{n_r}{n_i \text{ av}} \right)$$

NG

Make sure that the calculated life is suitable for the application.

OK

Gear is suitable for torque and speed requirements

Also consider output bearing, environment, etc.

Consider a different size or change operating requirements

Values of an each Load Torque Pattern

Load Torque	T_n (Nm)
Time	t_n (sec)
Output Speed	n_n (rpm)

no max = 14 rpm
ni max = 1800 rpm

Normal Operating Pattern

Acceleration	$T_1 = 400 \text{ Nm}$, $t_1 = 0.3 \text{ sec}$, $n_1 = 7 \text{ rpm}$
Regular Operation Stop	$T_2 = 320 \text{ Nm}$, $t_2 = 3 \text{ sec}$, $n_2 = 14 \text{ rpm}$
Deceleration	$T_3 = 200 \text{ Nm}$, $t_3 = 0.4 \text{ sec}$, $n_3 = 7 \text{ rpm}$
Dwell	$T_4 = 0 \text{ Nm}$, $t_4 = 0.2 \text{ sec}$, $n_4 = 0 \text{ rpm}$

$T_s = 500 \text{ Nm}$, $t_s = 0.15 \text{ sec}$, $n_s = 14 \text{ rpm}$

$L_{10} > 7000 \text{ hrs.}$

Oil Lubrication

T_{av} (Nm)

$$T_{av} = \sqrt[3]{\frac{7\text{rpm} \cdot 0.3\text{sec} \cdot |400\text{Nm}|^3 + 14\text{rpm} \cdot 3\text{sec} \cdot |320\text{Nm}|^3 + 7\text{rpm} \cdot 0.4\text{sec} \cdot |200\text{Nm}|^3}{7\text{rpm} \cdot 0.3\text{sec} + 14\text{rpm} \cdot 3\text{sec} + 7\text{rpm} \cdot 0.4\text{sec}}}$$

$T_{av} = 319\text{Nm} < 466\text{Nm}$ (for CSD-50-100-2A-GR)

no av (rpm)

$$\frac{7\text{rpm} \cdot 0.3\text{sec} + 14\text{rpm} \cdot 3\text{sec} + 7\text{rpm} \cdot 0.4\text{sec}}{0.3\text{sec} + 3\text{sec} + 0.4\text{sec} + 0.2\text{sec}} = 12 \text{ rpm}$$

(R)

$$\frac{1800 \text{ RPM}}{14 \text{ rpm}} = 128.6 > 100$$

$$n_i \text{ av} = 12\text{rpm} \cdot 100 = 1200\text{rpm}$$

$$n_o \text{ max} \quad n_i \text{ max (rpm)}$$

$$n_i \text{ max} = 14\text{rpm} \cdot 100 = 1400\text{rpm}$$

$n_i \text{ av} = 1440\text{rpm} < 3600\text{rpm}$ (for CSD-50-100-2A-GR)
 $n_i \text{ max} = 1680\text{rpm} < 5600\text{rpm}$ (for CSD-50-100-2A-GR)

Confirm that T_1 and T_3 are within a

OK

T_1, T_3 (Nm)

$T_1 = 400\text{Nm} < 686\text{Nm}$ (for CSD-50-100-2A-GR)

$T_3 = 200\text{Nm} < 686\text{Nm}$ (for CSD-50-100-2A-GR)

OK

T_s (Nm)

$T_s = 500\text{Nm} < 1440\text{Nm}$ (for CSD-50-100-2A-GR)

OK

N_s Calculate an allowable number of rotation(N_s) and confirm $\leq 1.0 \times 10^4$

$$N_s = \frac{10^4}{2 \cdot \frac{14\text{rpm} \cdot 100}{60} \cdot 0.15} \quad N_s = 1429 < 1.0 \times 10^4$$

OK

Calculate a life time.

$$L_{10} = 7000 \frac{(329\text{Nm})^3}{1319\text{Nm}} \cdot \frac{(2000\text{rpm})}{1440\text{rpm}}$$

$$L_{10} = 10665 > 7000 (L_{B10})$$

OK

CSD-50-100-2A-GR

Consider a different size or change operating requirements

Outside appearance varies depending on size.

Weight

Note: Standard dimension for size 14 and 17 is the maximum bore.

Dimensions for BB Table 8

unit:mm

Size	20	25	32	40	50
ø KH6	20 ^{+0.013} ₀	24 ^{+0.013} ₀	32 ^{+0.016} ₀	40 ^{+0.016} ₀	50 ^{+0.016} ₀
U 12	12	12	14	14	
ø V	3.4	4.5	5.5	6.6	9
ø T	26	32	42	52	65
ø Z ₁	0.2	0.25	0.25	0.3	0.5

Note: Standard dimension for size 14 and 17 is the maximum bore.

- Installed surface on Circular Spline is shown as A.
Use this surface for installation in case.
- Dimensions shown below may be modified as a special order.
B: Dimension of Wave generator
U and V: Dimension of Flexspline
L and M: Dimension of Circular spline
- Dimensions for C•D•G must meet the tolerance values shown above.
- øa, b, c must exceed the values shown above due to deformation of the flexspline.

Lubricant

Grease lubricant is the standard for the CSD unit. The temperature range is shown below. (Exceptions are shown on page 17.)

Lubricant		
Grease	Harmonic Grease	SK-1A
Grease	Harmonic Grease	SK-2
Grease	Harmonic Grease	4B-No.2
Oil	Industrial gear oil #2(high pressure)	ISO VG68

Lubricant		
Grease	SK-1A	0°C~+40°C
Grease	SK-2	0°C~+40°C
Grease	4B-No.2	-10°C~+70°C
Oil	ISO VG68	0°C~+40°C

Harmonic Grease SK-1A

This grease is developed for a Harmonic Drive® gear and features good durability and efficiency.

Harmonic Grease SK-2

This grease is developed for a small size Harmonic Drive® gear and features smooth rotation of the Wave Generator since high pressure additive is liquefied.

Harmonic Grease 4BNo.2

This grease is developed for Harmonic Drive® gear and features long life and a wide range of temperature.

Note 1

Grease lubrication must have proper sealing, this is essential for 4B No.2.

Rotating part: Oil seal with spring is needed.

Mating part: O ring or seal adhesive is needed.

Note 2

The grease has the highest deterioration rate in the region where the grease is subjected to the greatest shear (near wave generator).

Its viscosity is between JIS No.0 and No.00 depending on the operation.

Recommended Grease

Size	14	17	20	25	32	40	50
SK-1A	—	—	O	O	O	O	O
SK-2	O	O	Δ	Δ	Δ	Δ	—
4BNo.2	•	•	•	•	•	•	•

•: recommended grease for long life and high load O: Standard Δ: Semistandard

Characteristics of Grease

Durability	O	O	•
Fretting Resistance	O	O	•
Low Temp	Δ	Δ	•
Grease Leakage	•	•	Δ

•: Excellent O: Good Δ: Exercise Caution

Recommended Grease

Grease	SK-1A	SK-2	4B No.2
Base Oil	Refined mineral hydrocarbon base oil	Refined mineral hydrocarbon base oil	Hydrocarbon type synthetic oil and polymer
Thickening Agent	Lithium soap thickener	Lithium soap thickener	Urea
Additive	Organic molybdenum, etc.	Organic molybdenum, etc.	Organic molybdenum, etc.s
NLGI Consistency No.	No.2	No.2	No.1.5
Viscosity (25C) cSt	265 to 295	265 to 295	290 to 320
Melting Point	197°C	198°C	247°C
Color	Yellow	Green	Light Yellow
Life	5 Years in Airtight Container		

Recommended Dimensions for Inner Case

Recommended dimensions for inner case must meet with numbers shown below. These dimensions must be maintained to prevent damage to the gear and to maintain a proper grease cavity.

Figure 4

Recommended Dimensions for Inner Case Table 9

Unit: mm

Size	14	17	20	25	32	40	50
ϕa	38	45	53	66	86	106	133
b	6.5	7.5	8	10	13	16	19.5
c	1(3)	1(3)	1.5(4.5)	1.5(4.5)	2(6)	2.5(7.5)	3.5
$\phi d^{+0.5}_0$	16	26	30	37	37	45	45

Note: Values in parenthesis show the value when the Wave Generator is pointing up.

Figure 5

Grease Usage Table 10

Unit: g

Size	14	17	20	25	32	40	50
amount	3.5	5.2	9.0	17	37	68	131

Grease Change

The wear characteristics of the gear is strongly influenced by the condition of the grease lubrication. The condition of the grease is affected by the ambient temperature. The graph shows the maximum number of input rotations for various temperatures. This graph applies to applications where the average load torque does not exceed the rated torque.

In cases where the average load torque exceeds rated torque, calculate the grease change interval using the equation shown below.

Equation where average load torque exceeds rated torque
[Equation [3]]

$$L_{GT} = L_{GTn} \times \left(\frac{T_r}{T_{av}} \right)^3$$

Symbol of Equation [2]	
L_{GT}	Grease change (average torque is over rated torque), input rotations
L_{GTn}	Grease change (average torque is below rated torque), input rotations (From Graph)
T_r	Rated Torque
T_{av}	Average load torque on output

Figure 6

Oil Temperature

In normal use, the oil temperature must not exceed 90°C, Above this temperature oil quickly loses its lubricating capabilities.

Other notes: Avoid mixing different kinds of oil. The gear should be in an individual case when installed.

High Temperature Lubricants

Harmonic Grease 4B No.2

Type of lubricant	Standard temperature range	Possible temperature range
grease	-10°C~+110°C	-50°C~+130°C

High Temperature Lubricant

Type of lubricant	Name of lubricant and manufacturer	Possible temperature range
grease	Mobil Grease 28	-5°C~+160°C
oil	Mobil SHC-626	-5°C~+140°C

Standard temperature is the grease temperature during operation. It is not the ambient temperature.

Oil Change

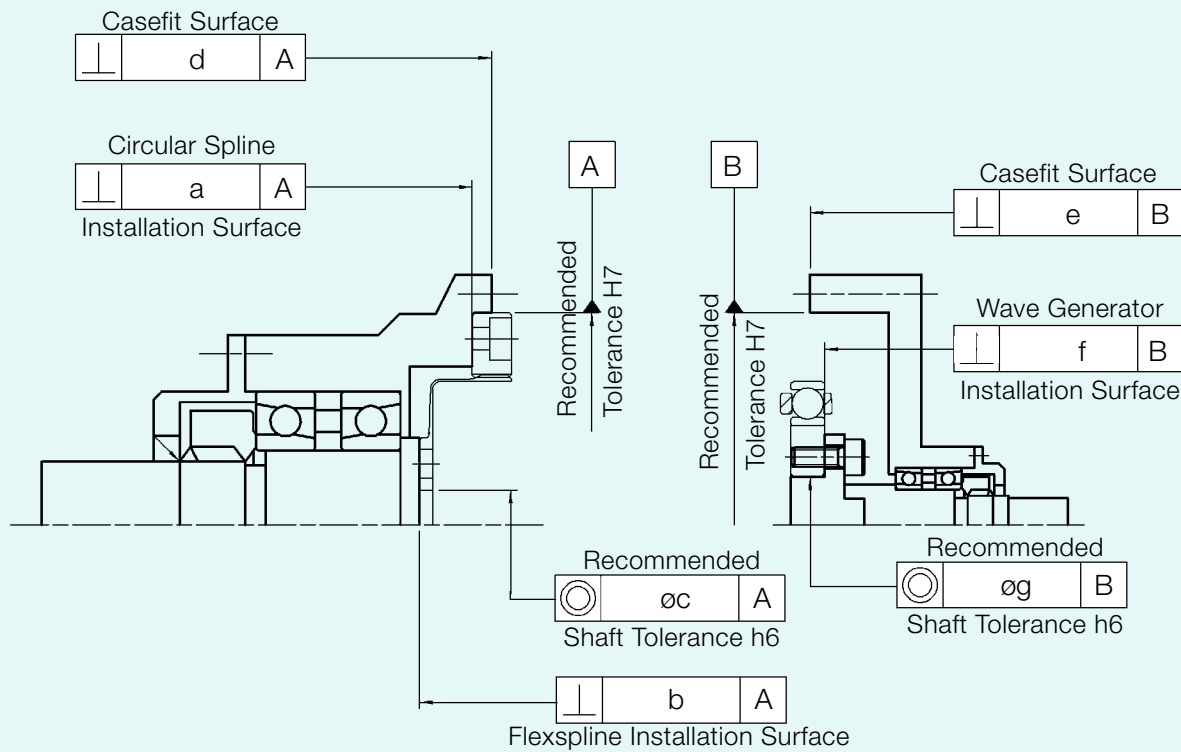

The first oil change should be performed after 100 hours of operation. The need to perform subsequent oil changes will depend on operating conditions, but should take place at intervals of approximately 1000 running hours.

Low Temperature Lubricant

Type of lubricant	Name of lubricant and manufacturer	Possible temperature range
Grease	Multemp SH-K2 Kyodo Yushi	-30°C~+50°C
	Iso Flex LDS-18 special A NOK kluber	-25°C~+80°C
Oil	SH-200-100CS Tore Silicon	-10°C~+110°C
	Shintesso D-32EP NOK kluber	-25°C~+90°C

The temperature range of the grease can be extended as indicated in the possible temperature range shown. At the low end of this range the efficiency will be low due to an increase in viscosity of the lubricant. At the high end of this range the lubricant life will be low due to an increased deterioration rate from the high temperature.

Recommended Tolerances for Assembly

Tolerance for Assembly Table 11

unit:mm

Size	14	17	20	25	32	40	50
a	0.011	0.012	0.013	0.014	0.016	0.016	0.018
b	0.008	0.011	0.014	0.018	0.022	0.025	0.030
ø c	0.015	0.018	0.019	0.022	0.022	0.024	0.030
d	0.011	0.015	0.017	0.024	0.026	0.026	0.028
e	0.011	0.015	0.017	0.024	0.026	0.026	0.028
f	0.008	0.010	0.010	0.012	0.012	0.012	0.015
ø g	0.016	0.018	0.019	0.022	0.022	0.024	0.030

Sealing structure

A seal structure is needed to maintain the high durability of the gear and prevent grease leakage.

Key Points to Verify

- Rotating parts should have an oil seal (with spring), surface should be smooth (no scratches)
- Mating flanges should have an O Ring, seal adhesive
- Screws should have a thread lock (Loctite 242 recommended) or seal adhesive.

Note: If you use Harmonic Grease 4BNo.2, strict sealing is required.

Direction for Thrust Force of Wave Generator

Figure 7

Axial Force of Wave Generator

When a CSD gear is used to accelerate a load, the deflection of the Flexspline leads to an axial force acting on the Wave Generator. This axial force, which acts in the direction of the closed end of the Flexspline, must be supported by the bearings of the input shaft (motor shaft).

When a CSD gear is used to decelerate a load, an axial force acts to push the Wave Generator out of the Flexspline cup. Maximum axial force of the Wave Generator can be calculated by the equation shown below. The axial force may vary depending on its operating condition. The value of axial force tends to be a larger number when using high torque, extreme low speed and constant operation. The force is calculated (approximately) by the equation. In all cases, the Wave Generator must be axially (in both directions), as well as torsionally, fixed to the input shaft.

Note: Please contact us for further information on attaching the Wave Generator to the input (motor) shaft.

Equation [4] for axial force

Gear Ratio	equation
$i=1/50$	$F=2 \times \frac{T}{D} \times 0.07 \times \tan 30^{\circ} + 2\mu PF$
$i=1/100$ and up	$F=2 \times \frac{T}{D} \times 0.07 \times \tan 20^{\circ} + 2\mu PF$

Symbols for equation [4]

F	thrust force	N
D	Gear Size x 0.00254	m
T	output torque	Nm
$2\mu PF$	thrust force by bearing	Nm (see table)

Calculation Example

size	:	32
Ratio	:	$i=1/50$
Output Torque	:	200Nm
$F=2 \times \frac{200}{(32 \times 0.00254)} \times 0.07 \times \tan 30^{\circ} + 16$		
$F=215N$		

Table 12

Thrust Force by Bearing		
CSD	Size	$2\mu PF$ (Nm)
	14	2.1
	17	4.1
	20	5.6
	25	9.8
	32	16
	40	24
	50	39

Torque transmission	Nm	55	90	155	188	422	810	1434

Note:

- 1. The material of the thread must withstand the clamp torque.
- 2. Recommended bolt: JIS B 1176 socket head cap screw strength range : JIS B 1051 over 12.9.
- 3. Torque coefficient : K=0.2
- 4. Clamp coefficient A=1.4
- 5. Friction coefficient on the surface contacted : 0.15

Component Assembly Procedure

Please see the following notes.

CSD assembly procedure

Note for assembly structure for CSD

Wave Generator

1. Avoid overloading the Wave Generator bearing during installation, rotate the Wave Generator as you easily install.
2. Since the Wave Generator of the CSD does not have an Oldham coupling, make sure that the position is within the recommended tolerance shown on page 18.
3. Installation bolts on Wave Generator and installation bolt on Flexspline should not interfere each other.

Circular Spline

1. Be sure flatness and skewness are minimized.
2. Make sure there are no burrs or foreign substances.
3. Make sure there is enough room to have the minimum clearance in the housing.
4. Make sure that the Circular Spline can rotate in the housing when it is installed
5. When a bolt is inserted into a bolt hole, make sure that the bolt hole is located properly.
7. Bolts should not be tightened at the same time. Apply half of the recommended torque to tighten bolts, and then tighten bolts at the recommended torque. The order of tightening bolts should be done diagonally.

Avoid using pins to secure the Circular Spline if possible.

Flexspline

1. Be sure flatness and skewness are minimized.
2. Make sure there are no burrs or foreign substances.
3. Make sure there is enough room to have the minimum clearance in the housing.
4. When a bolt is inserted into a bolt hole, make sure that the bolt hole is located properly.
5. Bolts should not be tightened at the same time. Apply half of the recommended torque to tighten bolts, and then tighten bolts at recommended torque. The order of tightening bolts should be done diagonally.

Make sure that Circular Spline and Flexspline mesh properly.

Do not damage the Flexspline during assembly.

Note to prevent corrosion

The standard CSD has not been treated for preventing corrosion. If needed, apply rust prevention on metal surfaces. As a special order, Harmonic Drive LLC can provide stainless steel components or surface treatments.

- The following parameters can be modified to accommodate customer specific requirements.

Wave generator : ϕC Flexspline : ϕO Circular Spline : X_1, X_2

- Minimum housing clearance parameters $\phi a, b, \phi c, d$ must be maintained to prevent damage to the gear during operation.

Specifications for Cross Roller Bearing

Specification for Cross Roller Bearing

Housed units incorporate a precise cross roller bearing to directly support a load. The inner race of the bearing forms the output flange.

Please calculate maximum load moment, life of cross roller bearing, and static safety factor to fully maximize the performance of the housed unit (gearhead).

Calculation Procedure

1. Maximum Load Moment (Mmax)

2. Output Bearing Life

3. Static Safety Factor

Specification for cross roller bearing

Specification for cross roller bearing is shown on figure.

Table 17

Size	Pitch Circle dp m	Offset R mm	Basic Dynamic Rated Load C		Basic Static Rated Load Co		Allowable Moment Load Mc		Moment Rigidity Km x10 ⁴	
			X10 ³ N	lb	X10 ³ N	lb	Nm	in-lb	Nm/rad	in-lb/ arc-min
14	0.0503	11.1	29	652	43	967	37	327	7.08	182
17	0.061	11.5	52	1169	81	1821	62	548	12.7	326
20	0.070	11.0	73	1641	110	2473	93	823	21	540
25	0.086	12.1	109	2451	179	4024	129	1141	31	796
32	0.112	17.3	191	4294	327	7352	290	2566	82.1	2110
40	0.133	19.5	216	4856	408	9173	424	3752	145	3726

Basic dynamic rated load is a constant radial load where the basic dynamic rated life of CRB is 1×10^6 rotations.

Basic static rated load is a static load where the value of moment rigidity is the average value.

For the following size and gear ratio combinations, the life of the cross roller bearing operating at the allowable moment load is less than the life of the wave generator bearing ($L_{10} = 7000$ hr) operating at 2000rpm and rated torque.

Table 18

Size	Gear Ratio	
14	50	100
17	50	
20	50	

How to Calculate the Maximum Load Moment

How to calculate the Maximum load moment is shown below. Please be sure that M_c is equal or greater than M_{max} .

$$M_{max} = F_{rmax} \cdot (L_r + R) + F_{amax} \cdot L_a$$

How to Calculate an Average Load

To calculate average radial load, average axial load or average output speed, follow steps below.

When the radial load and axial load vary, the life of cross roller bearing can be determined by converting to an average load. (see figure 10)

equation (5) Calculate Average Radial Load

$$F_{rav} = \sqrt[10/3]{\frac{n_1 t_1 |F_{r1}|^{10/3} + n_2 t_2 |F_{r2}|^{10/3} \dots + n_n t_n |F_{rn}|^{10/3}}{n_1 t_1 + n_2 t_2 \dots + n_n t_n}}$$

F_{r1} is radial load in t_1 , F_{r3} is radial load in t_3 .

equation (6) Calculate Average Axial Load(F_{aav})

$$F_{aav} = \sqrt[10/3]{\frac{n_1 t_1 |F_{a1}|^{10/3} + n_2 t_2 |F_{a2}|^{10/3} \dots + n_n t_n |F_{an}|^{10/3}}{n_1 t_1 + n_2 t_2 \dots + n_n t_n}}$$

F_{a1} is axial load in t_1 , F_{a3} is axial load in t_3 .

Figure 9

equation (7) Calculate Average Output Speed

$$N_{av} = \frac{n_1 t_1 + n_2 t_2 \dots + n_n t_n}{t_1 t_2 \dots + t_n}$$

Calculate radial load coefficient (X) axial load (Y)

F_{aav}	≤ 1.5	1	0.45
$F_{rav} + 2 (F_{rav} (L_r + R) + F_{aav} \cdot L_a) / dp$			
F_{aav}	> 1.5	0.67	0.67
$F_{rav} + 2 (F_{rav} (L_r + R) + F_{aav} \cdot L_a) / dp$

How to Calculate Static Safety Coefficient

Basic static rated load is an allowable limit for static load, but its limit is determined by usage. In this case, static safety coefficient of the cross roller bearing can be calculated by equation 10.

Reference values under general conditions are shown on list 3.

Static equivalent radial load can be calculated by equation (12)

equation (10)

$$f_s = \frac{C_0}{P_0}$$

equation (12)

$$P_0 = F_{rmax} + \frac{2M_{max}}{d} + 0.44 \cdot F_{amax}$$

Symbols for equation (9)

list 3

Load Conditions	Lower Limit Value for f_s
Impact loads	$1-1.5 \geq 2$
Normal loads	≥ 1.5
High accuracy required	≥ 3

How to Calculate Life for Oscillating Motion

The Life of a cross roller bearing in a oscillating operation can be calculated by equation 11

equation (11)

$$L_{oc} = \frac{10^6}{60 \times n_1} \times \frac{90}{\theta} \times \left(\frac{C}{f_w \cdot P_c} \right)^{10/3}$$

Symbol of equation (11)

θ	Angle of oscillation/2	degrees	figure 11

figure 11

A small angle of oscillation (less than 5 degrees) may cause fretting corrosion to occur since lubrication may not circulate properly.

Lubricant

Grease lubricant is the standard for the SHD unit. The temperature range is shown below. (Exceptions are shown on page 17.)

Lubricant			Lubricant		
Grease	Harmonic Grease	SK-1A	Grease	SK-1A	0°C~ + 40°C
Grease	Harmonic Grease	SK-2	Grease	SK-2	0°C~ + 40°C
Grease	Harmonic Grease	4B-No.2	Grease	4B-No.2	-10°C~ + 70°C

Harmonic Grease SK-1A

This grease is developed for a Harmonic Drive® gear and features good durability and efficiency.

Harmonic Grease SK-2

This grease is developed for a small size Harmonic Drive® gear and features smooth rotation of the Wave Generator since high pressure additive is liquefied.

Harmonic Grease 4B No.2

This grease is developed for Harmonic Drive® gearing and features long life and a wide range of temperature.

Note 1

Grease lubrication must have proper sealing, this is essential for 4BNo. 2.

Rotating part: Oil seal with spring is needed.

Mating part: O ring or seal adhesive is needed.

Note 2

The grease has the highest deterioration rate where the grease is subjected to the greatest shear (near wave generator). Its viscosity is between JIS No.0 and No. 00 depending on the operation.

Recommended Grease

Size	14	17	20	25	32	40

grease amount	5	9	13	24	51	99

The Flexspline teeth, Circular spline teeth and Cross roller bearing are grease lubricated at the Factory.

Figure 13

Grease Change

The wear characteristics of the gear are strongly influenced by the condition of the grease lubrication. The condition of the grease is affected by the ambient temperature. The graph shows the maximum number of input rotations for various temperatures. This graph applies to applications where the average load torque does not exceed the rated torque.

In cases where the average load torque exceeds, calculate the grease change interval using the equation shown below.

Equation where average load torque exceeds rated torque
[Equation 13]

$$L_{GT} = L_{GTn} \times \left(\frac{T_r}{T_{av}} \right)^3$$

Symbol of Equation [13]

L_{GT}	Grease change (Torque is over rated torque), input rotations
L_{GTn}	Grease change (Torque is below rated torque), input rotations (From Graph)
T_r	Rated Torque
T_{av}	Average load torque on output

Figure 14

Recommended Tolerances for Assembly

For peak performance of the SHD it is essential that the following tolerances be observed when assembly is complete.

Tolerances for Assembly Table 21

Size	14	17	20	25	32	40
a	0.016	0.021	0.027	0.035	0.042	0.048

c	0.011	0.012	0.013	0.014	0.016	0.016
d	0.008	0.010	0.012	0.012	0.012	0.012
ϕe	0.016	0.018	0.019	0.022	0.022	0.024

Unit:mm

Sealing structure

A seal structure is needed to maintain the high durability of the gear and prevent grease leakage.

Key Points to Verify

- Rotating parts should have an oil seal (with spring), surface should be smooth (no scratches)
- Mating flanges should have an O Ring, seal adhesive
- Screws should have a thread lock (Loctite 242 recommended) or seal adhesive.

Note: If you use Harmonic grease 4BNo.2, strict sealing is required.

Direction for Thrust Force of Wave Generator

Figure 15

Axial Force of Wave Generator

When a SHD gear is used to accelerate a load, the deflection of the Flexspline leads to an axial force acting on the Wave Generator. This axial force, which acts in the direction of the back end of the Flexspline, (toward the left in fig.15) must be supported by the bearings of the input shaft (motor shaft).

When a SHD gear is used to decelerate a load, an axial force acts to push the Wave Generator out of the Flexspline (toward the right in fig.15). Maximum axial force of the Wave Generator can be calculated by the equation shown below. The axial force may vary depending on its operating condition. The value of axial force tends to be a larger number when using high torque, extreme low speed and constant operation. The force is calculated (approximately) by the equation. In all cases, the Wave Generator must be axially (in both directions), as well as torsionally, fixed to the input shaft.

(note) Please contact us for detailed information on attaching the Wave Generator to the input (motor) shaft.

Equation [14] for axial force

Gear Ratio	equation
$i=1/50$	$F=2 \times \frac{T}{D} \times 0.07 \times \tan 30^\circ + 2\mu PF$
$i=1/100$ and up	$F=2 \times \frac{T}{D} \times 0.07 \times \tan 20^\circ + 2\mu PF$

Symbols for equation [4]

F	thrust force	N
D	Gear Size x 0.00254	m
T	output torque	Nm
$2\mu PF$	thrust force by bearing	Nm (see table)

Calculation Example

size	:	32
Ratio	:	$i=1/50$
Output Torque	:	200Nm
$F=2 \times \frac{200}{(32 \times 0.00254)} \times 0.07 \times \tan 30^\circ + 16$		
$F=215N$

Manufacturing for Mating Part and Housing

When the housing interferes with corner "A" shown in fig. 17, an undercut in the housing is recommended as shown in fig. 18.

Figure 17

Figure 18

Assembly Order for Basic Three Elements

The recommended sequence of assembly is illustrated below.

Only after the Circular Spline and Flexspline are assembled in equipment is the Wave Generator assembled. If assembly is performed using a different method, Dedoidal assembly or teeth breakage may occur. It is essential that teeth of the Flexspline and Circular Spline mesh symmetrically for proper function. An eccentric tooth mesh (Dedoidal), will result in noise and may lead to early failure of the gear.

Figure 19

SHD assembly procedure

Note for assembly structure for SHD

Wave Generator

1. Avoid overloading the Wave Generator bearing during installation, rotate the Wave Generator as you easily install.
2. Since the Wave Generator of the CSD does not have an Oldham coupling, make sure that the position is within the recommended tolerance shown on page 32.
3. Installation bolts on Wave Generator and installation bolt on Flexspline should not interfere each other.

Circular Spline

1. Be sure flatness and skewness are minimized.
2. Make sure there are no burrs or foreign substances.
3. Make sure there is enough room to have the minimum clearance in the housing.
4. Make sure that the Circular Spline can rotate in the housing when it is installed.
5. When a bolt is inserted into a bolt hole, make sure that the bolt hole is located properly.
7. Bolts should not be tightened at the same time. Apply half of the recommended torque to tighten bolts, and then tighten bolts at the recommended torque. The order of tightening bolts should be done diagonally.

Avoid using pins to secure the Circular Spline if possible.

Flexspline

1. Be sure flatness and skewness are minimized.
2. Make sure there are no burrs or foreign substances.
3. Make sure there is enough room to have the minimum clearance in the housing.
4. When a bolt is inserted into a bolt hole, make sure that the bolt hole is located properly.
5. Bolts should not be tightened at the same time. Apply half of the recommended torque to tighten bolts, and then tighten bolts at recommended torque. The order of tightening bolts should be done diagonally.

Make sure that Circular Spline and Flexspline mesh properly.

Do not damage the Flexspline during assembly.

Note to prevent corrosion

The standard SHD has not been treated for preventing corrosion. If needed, apply rust prevention on metal surfaces. As a special order, Harmonic Drive LLC can provide stainless steel components or surface treatments.

Efficiency

The efficiency depends on the conditions shown below. Efficiency depends on gear ratio, input speed, load torque, temperature, quantity of lubricant and type of lubricant.

Measurement Condition for Efficiency Graphs

Installation:	Based on recommended tolerance
Load Torque:	Rated Torque
Lubricant:	Harmonic Grease SK-1A (size 20 and up) Harmonic Grease SK-2 (size 14, 17) Harmonic Grease 4B No.2 (SHD Output Bearing)
Grease quantity:	Recommended quantity

Please contact us for details pertaining to recommended oil lubricant for CSD.

Starting Torque and Backdriving Torque

Starting Torque

Starting torque is the torque required to commence rotation of the input element (high speed side), with no load being applied to the output. The table below indicates the maximum values. The lower values are approximately 1/2 to 1/3 of the maximum values.

Component Type Backdriving Torque

Backdriving torque is the torque required to commence rotation of input element (high speed side) when torque is applied on the output side (low speed side). The table below indicates the maximum values. The typical values are approximately 1/2 to 1/3 of the maximum values. The backdriving torque should not be relied upon to provide a holding torque to prevent the output from backdriving. A failsafe brake should be used for this purpose.

Measurement condition: Ambient temperature 20°C

Values shown below vary depending on condition. Please use values as a reference.

Positioning Accuracy

The positioning accuracy of the gear represents a linearity error between the input and output angle. The position error is the difference between theoretical and actual output rotation angle.

The positioning accuracy is measured for one complete output revolution using a high resolution measurement system. The measurements are carried out without reversing direction.

The positioning accuracy is defined as the difference between the maximum positive and maximum negative deviation from the theoretical position.

θ_{er} Positioning Accuracy
 θ_1 Input Angle
 θ_2 Actual Output Angle
 R Gear Ratio ($i = I:R$)

$$\theta_{er} = \theta_2 - \frac{\theta_1}{R} \quad \text{equation [15]}$$

Torsional Stiffness

Torsional stiffness is determined by applying a load to the output of the gear, with the input rotationally locked. The angular rotation is measured as the load is increased. The typical curve (shown in the figure 21) is non-linear. The stiffness is determined by the slope of this curve. For simplicity, the curve is approximated by 3 straight lines having stiffness of K_1 , K_2 , and K_3 . Stiffness K_1 applies for output torque of 0 to T_1 . Stiffness K_3 applies for output torque greater than T_2 . Stiffness K_2 applies for output torque between T_1 and T_2 . Typical stiffness values are shown in tables 29 to 32.

SHD - Torsional Stiffness for Ratio 1/100 and up

Table 32

Size		14	17	20	25	32	40	
T ₁	Nm	2.0	3.9	7.0	14	29	54	
K ₁	X10 ⁻⁴ Nm/rad	0.4	0.84	1.3	2.7	6.1	11	
Ø ₁	X10 ⁻⁴ rad	5.0	4.6	5.4	5.2	4.8	4.9	
	arc min	1.7	1.6	1.8	1.8	1.7	1.7	
T ₂	Nm	6.9	12	25	48	108	196	
K ₂	X10 ⁻⁴ Nm/rad	0.44	0.94	1.7	3.7	7.8	14	
Ø ₂	X10 ⁻⁴ rad	16	13	15	13	14	14	
	arc min	5.4	4.3	5.0	4.5	4.8	4.8	
K ₃	X10 ⁻⁴ Nm/rad	0.61	1.3	2.5	4.7	11	20	

Numbers are average value.

Calculate Torsion Angle

1. For $T < T_1$: $\emptyset = T/K_1$
2. For $T_1 < T < T_2$: $\emptyset = T_1/K_1 + (T - T_1)/K_2$
3. For $T_2 < T$: $\emptyset = T_1/K_1 + (T_2 - T_1)/K_2 + (T - T_2)/K_3$

Note: Units for T, T_1 , T_2 , K, K_1 , K_2 , K_3 , and \emptyset must be consistent.

Hysteresis Loss

A typical hysteresis curve is shown in figure 20. With the input locked, a torque is applied from 0 to \pm Rated Torque. Hysteresis measurement is shown in the figure. The following table shows typical hysteresis values.

Size		14	17	20	25	32	40	50
50	$\times 10^{-4}$ rad	7.3	4.4	4.4	4.4	4.4	4.4	4.4
	arc min	2.5	1.5	1.5	1.5	1.5	1.5	1.5
100	$\times 10^{-4}$ rad	5.8	2.9	2.9	2.9	2.9	2.9	2.9
and up	arc min	2.0	1.0	1.0	1.0	1.0	1.0	1.0

All products are warranted to be free from design or manufacturing defects for a period of one year from the date of shipment. Such items will be repaired or replaced at the discretion of Harmonic Drive LLC. The seller makes no warranty, expressed or implied, concerning the material to be furnished other than it shall be of the quality and specifications stated. The seller's liability for any breach is limited to the purchase price of the product. All efforts have been made to assure that the information in this catalog is complete and accurate. However, Harmonic Drive LLC is not liable for any errors, omissions or inaccuracies in the reported data. Harmonic Drive LLC reserves the right to change the product specifications, for any reason, without prior notice.
