**DDP Series**

**Control Modes**
- Indexer, Point-to-Point, PVT
- Camming, Gearing, Position, Velocity, Torque

**Command Interface**
- Stepper commands
  - *Single-ended or Differential selectable*
- CANopen/DeviceNet
- ASCII and discrete I/O
- ±10V position/velocity/torque command
- PWM velocity/torque command
- Master encoder (Gearing/Camming)

**Communications**
- CANopen/DeviceNet
- RS232

**Feedback**
- Digital Quad A/B encoders
- Analog sin/cos encoder (-S option)
- Brushless resolver (-R option)
- Aux encoder / emulated encoder output
- Digital Halls

**I/O - Digital**
- 12 inputs, 3 outputs

**Dimensions:**
- 168 x 99 x 31 [6.6 x 3.9 x 1.2]

**DESCRIPTION**

*DDP Series* is a high-performance, DC powered drive for position, velocity (using encoder, Halls, or BEMF), and torque control of brushless and brush motors. It can operate as a distributed drive using the CANopen or DeviceNet protocols, or as a stand-alone drive accepting analog or digital commands from an external motion controller. In stand-alone mode, current and velocity modes accept digital 50% PWM or PWM/polarity inputs as well as ±10V analog. In position mode inputs can be incremental position commands from step-motor controllers, analog ±10V, or A/B quadrature commands from a master-encoder. Pulse to position ratio is programmable for electronic gearing.

Drive commissioning is fast and simple using HDM software operating under Windows® and communicating with *DDP Series* via CAN or an RS-232 link. CANopen is the default protocol, DeviceNet is supported by downloading firmware from the web-site. CAN address selection is by a 16-position rotary switch. If there are more than sixteen devices on the CAN bus, the additional address bits needed can come from programmable inputs, or can be set in flash memory.

DSP Series models operate as Motion Control Devices under the DSP-402 protocol of the CANopen DS-301 V4.01 (EN 50325-4) application layer.

DSP-402 modes supported include: Profile Position, Profile Velocity, Profile Torque, Interpolated Position Mode (PVT), and Homing. The two CAN ports are optically isolated from drive circuits.

Feedback options include digital quad A/B and absolute SSI encoders as standard. Sin/cos analog encoders are supported in models with an “S” appended to the part number. Resolver feedback is supported in models with “R” appended to the part number. There are twelve digital inputs eleven of which have programmable functions. These include CAN address, motion-abort, limit & home switches, stepper/encoder pulse inputs, reset, digital torque or velocity reference, and motor over-temperature. Input [IN1] is dedicated for the drive Enable. There are three programmable logic outputs for reporting an drive fault, motor brake control, or other status indications.

Drive power is transformer-isolated DC from regulated or unregulated power supplies. An AuxHV input powers control circuits for “keep-alive” operation permitting the drive power stage to be completely powered down without losing position information, or communications with the control system.

Aux HV  +20 to +HV Vdc @ 500 mAdc maximum

PWM OUTPUTS
Type  3-phase MOSFET inverter, 15 kHz center-weighted PWM, space-vector modulation
PWM ripple frequency  30 kHz

DIGITAL CONTROL
Current, velocity, position. 100% digital loop control
Sampling rate (time) Velocity, position loops: 3 kHz (333 µs)
Commutation Sinusoidal, field-oriented control for brushless motors
Modulation Center-weighted PWM with space-vector modulation
Bandwidths Current loop: 2.5 kHz typical, bandwidth will vary with tuning & load inductance
HV Compensation Changes in bus voltage do not affect bandwidth
Minimum load inductance 200 µH line-line

COMMAND INPUTS
Profile Position, Profile Velocity, & Profile Torque, Interpolated Position (PVT), Homing
Digital position reference Step/Direction, CW/CCW Stepper commands (2 MHz maximum rate)
Digital torque & velocity reference PWM , Polarity PWM = 50% +/-50%, no polarity signal required
HV Compensation Changes in bus voltage do not affect bandwidth
Minimum load inductance 200 µH line-line

DIGITAL INPUTS
Number 12
Inputs [IN1~5,11,12] 74HC14 Schmitt trigger, 330 µs RC filter, Vin-LO < 1.35 Vdc, Vin-HI > 3.65 Vdc, +30 Vdc max
[IN1] dedicated to drive enable function, other inputs are programmable
Input [IN6] 74HC14 Schmitt trigger, 100 ns RC filter, Vin-LO < 1.35 Vdc, Vin-HI > 3.65 Vdc, +12 Vdc max
Inputs [IN7~10] Single-ended Comparator with 2.5 Vdc reference, 100 ns RC filter, Vin-LO < 2.3 Vdc, Vin-HI > 2.45 Vdc
All inputs 10 kΩ pull-up to +5 Vdc or pull-down to ground, selectable in groups, active level programmable

DIGITAL OUTPUTS
Number 3
[OUT1], [OUT2], [OUT3] Current-sinking MOSFET with 1 kΩ pullup to +5 Vdc through diode
Current rating 1 Adc max, +30 Vdc max. Functions programmable, +10 Vdc
External flyback diode required if driving inductive loads

MULTI-MODE ENCODER PORT
Operation Programmable as input for secondary (dual) digital encoder or as buffered outputs in quad A/B/X format for digital motor feedback encoder,
or emulated encoder outputs from analog sin/cos motor feedback encoder
Signals Quad A/B Encoder: A, /A, B, /B, X, /X
Frequency As input for digital encoder: 5M lines/sec, 20 M count/sec (after quadrature)
As buffered outputs for digital motor encoder: 5M lines/sec, 20 M count/sec (after quadrature)
As emulated encoder outputs for sin/cos analog motor encoder: 4.5 M lines/sec, 18 M count/sec (after quadrature)

Input/output 26C32 differential line receiver, or 26C31 differential line driver

RS-232 PORT
Signals RxD, TxD, Gnd in 6-position, 4-contact RJ-11 style modular connector.
Mode Full-duplex, serial communication port for drive setup and control, 5,600 to 115,200 Baud
Protocol ASCII or Binary format
Multi-drop ASCII interface from single RS-232 port to control multiple drives (RTL, DDP)
Drive with serial connection acts as master for bi-directional data flow to other drives using CAN connections in daisy-chain from drive to drive

CAN PORT
Signals CANH, CANL, Gnd in dual 8-position RJ-45 style modular connectors, wired as per CAN Cia DR-303-1, V1.1
CAN interface circuit and +5 Vdc supply are optically isolated from drive circuits
Format CAN V2.0b physical layer for high-speed connections compliant
Data CANopen Device Profile DDP-402
Address selection 16 position rotary switch on front panel with 3 additional address bits available as digital inputs or programmable to flash memory
### FEEDBACK

#### DIGITAL QUAD A/B ENCODER
- **Type:** Quadrature, differential line driver outputs
- **Signals:** A, /A, B, /B, (X, /X, index signals optional)
- **Frequency:** 5 MHz line frequency, 20 MHz quadrature count frequency

#### ANALOG ENCODER (-S OPTION)
- **Type:** Sin/cos, differential line driver outputs, 0.5 Vpeak-peak (1.0 Vpeak-peak differential) centered about 2.5 Vdc typical. Common-mode voltage 0.25 to 3.75 Vdc
- **Signals:** Sin(+), sin(-), cos(+), cos(-)
- **Frequency:** 230 kHz maximum line (cycle) frequency
- **Interpolation:** 10 bits/cycle (1024 counts/cycle)

#### RESOLVER
- **Type:** Brushless, single-speed, 1:1 to 2:1 programmable transformation ratio
- **Resolution:** 14 bits (equivalent to a 4096 line quadrature encoder)
- **Reference frequency:** 7.5 kHz
- **Reference voltage:** 2.8 Vrms, auto-adjustable by the drive to maximize feedback
- **Reference maximum current:** 100 mA
- **Maximum RPM:** 10,000+

#### ENCODER EMULATION
- **Resolution:** Programmable to 16,384 counts/rev (4096 line encoder equivalent)
- **Buffered encoder outputs:** 26C31 differential line driver

#### DIGITAL HALLS
- **Type:** Digital, single-ended, 120° electrical phase difference
- **Signals:** U, V, W
- **Frequency:** Consult Harmonic Drive for speeds >10,000 RPM

#### ENCODER POWER SUPPLY
- **Power Supply:** +5 Vdc @ 400 mA to power encoders & Halls
- **Protection:** Current-limited to 750 mA @ 1 Vdc if overloaded
  Encoder power developed from +24 Vdc so position information is not lost when AC mains power is removed

### MOTOR CONNECTIONS
- **Phase U, V, W:** PWM outputs to 3-phase ungrounded Wye or delta connected brushless motors, or DC brush motors
- **Hall U, V, W:** Digital Hall signals, single-ended
- **Digital Encoder:** Quadrature encoder signals, A, /A, B, /B, X, /X, (differential (X or Index signal not required)
  26LS32 differential line receiver with 121 Ω terminating resistor between complementary inputs
- **Analog Encoder:** Sin/cos, differential line driver outputs, 0.5 Vpeak-peak (1.0 Vpeak-peak differential) centered about 2.5 Vdc typical. Common-mode voltage 0.25 to 3.75 Vdc
- **Signals:** Sin(+), sin(-), cos(+), cos(-)
- **Frequency:** 230 kHz maximum line (cycle) frequency
- **Interpolation:** Programmable: 10 bits/cycle (1024 counts/cycle)
- **Resolver:** R1, R2, S3, S1, S2, S4
- **Hall & encoder power:** +5 Vdc ±2% @ 250 mAdc max, current limited to 750 mAdc @ +1 Vdc if output overloaded
- **Motemp [INS]:** Motor overtemperature sensor input. Active level programmable
  Programmable to disable drive when motor over-temperature condition occurs
  Same input circuit as GP digital inputs (Digital Inputs above)
- **Brake [OUT1,2,3]:** Programmable for motor brake function, external flyback diode required

### STATUS INDICATORS
- **Amp Status:** Bicolor LED, drive status indicated by color, and blinking or non-blinking condition
- **CAN Status:** Bicolor LED, status of CAN bus indicated by color and blink codes to CAN Indicator Specification 303-3

### PROTECTIONS
- **HV Overvoltage:** +HV > HV<sub>max</sub> (See Input Power for HV<sub>max</sub>) Drive outputs turn off until +HV < HV<sub>max</sub>
- **HV Undervoltage:** +HV < +20 Vdc Drive outputs turn off until +HV > +20 Vdc
- **Drive over temperature:** Heat plate > 70°C. Drive outputs turn off
- **Short circuits:** Output to output, output to ground, internal PWM bridge faults
- **I2T Current limiting:** Programmable: continuous current, peak current, peak time
- **Motor over temperature:** Digital inputs programmable to detect motor temperature switch

### MECHANICAL & ENVIRONMENTAL
- **Size:** 6.58 in (167 mm) X 3.89 in (98.8 mm) X 1.17 in (29.7 mm)
- **Weight:** 0.94 lb (0.43 kg)
- **Ambient temperature:** 0 to +45°C operating, -40 to +85°C storage
- **Humidity:** 0 to 95%, non-condensing
- **Vibration:** 2 g peak, 10~500 Hz (sine), IEC60068-2-6
- **Shock:** 10 g, 10 ms, half-sine pulse, IEC60068-2-27
- **Contaminants:** Pollution degree 2
- **Environment:** IEC68-2-1990
- **Cooling:** Heat sink and/or forced air cooling required for continuous power output

Notes: 1. Digital input & output functions are programmable.

COMMUNICATIONS

**HDM SOFTWARE**

Drive setup is fast and easy using HDM software communicating via RS-232 or over the CAN bus. All of the operations needed to configure the drive are accessible through this powerful and intuitive program. Auto-phasing of brushless motor Hall sensors and phase wires eliminates "wire and try". Connections are made once and HDM does the rest thereafter. Encoder wire swapping to establish the direction of positive motion is eliminated. Motor data can be saved as .ccm files. Drive data is saved as .ccx files that contain all drive settings plus motor data. This eases system management as files can be cross-referenced to drives. Once a drive configuration has been completed systems can be replicated easily with the same setup and performance. When operating as a stand-alone drive that takes command inputs from an external controller, HDM is used for configuration. When operated as a CAN node, HDM can be used for programming before and after installation in a CAN network. The DDP Series can also be controlled via HDM while it is in place as a CAN node. During this process, drive operation as a CAN node is suspended. When adjustments are complete, HDM relinquishes control of the drive and returns it to the CAN node state.

**RS-232 COMMUNICATION**

DDP Series operates as a DTE device from a three-wire, full-duplex RS-232 port at 9,600 to 115,200 Baud. COM port settings must be “N81” (No parity, 8 data-bits, 1 stop-bit). The SER-CK Serial Cable Kit provides an adapter that connects to the COM port of a PC (a 9 position, male D-Sub connector) and accepts a modular cable with RJ-11 connectors for connection to the RS-232 port (J6).

**RS-232 “MULTI-DROP”**

The RS-232 specification makes no allowance for more than two devices on a serial link. But, multiple DDP Series drives can communicate over a single RS-232 port by daisy-chaining a master drive to other drives using CAN cables. In the CAN protocol, address 0 is reserved for the CAN master and thereafter all other nodes on a CAN network must have unique, non-zero addresses. When the DDP Series CAN address is set to 0, it acts as a CAN master, converting the RS-232 data into CAN messages and passing it along to the other drives which act as CAN nodes.

**ASCII COMMUNICATIONS**

The Harmonic Drive ASCII Interface is a set of ASCII format commands that can be used to operate and monitor DDP Series, and RTL Series amplifiers over an RS-232 serial connection. For instance, after basic amplifier configuration values have been programmed using HDM, a control program can use the ASCII Interface to:

- Enable the amplifier in Programmed Position mode.
- Home the axis.
- Issue a series of move commands while monitoring position, velocity, and other run-time variables.

Additional information can be found in the ASCII Programmers Guide on the Harmonic Drive website: ASCII Programmers Guide
COMMUNICATIONS (CONTINUED)

CANOPEN

Based on the CAN V2.0b physical layer, a robust, two-wire communication bus originally designed for automotive use where low-cost and noise-immunity are essential, CANopen adds support for motion-control devices and command synchronization. The result is a highly effective combination of data-rate and low cost for multi-axis motion control systems. Device synchronization enables multiple axes to coordinate moves as if they were driven from a single control card.

CANOPEN COMMUNICATION

DDP Series uses the CAN physical layer signals CANH, CANL, and GND for connection, and CANopen protocol for communication. Before installing the drive in a CAN system, it must be assigned a CAN address. A maximum of 127 CAN nodes are allowed on a single CAN bus. The rotary switch on the front panel controls the four lower bits of the seven-bit CAN address. When the number of nodes on a bus is less than sixteen, the CAN address can be set using only the switch.

For installations with sixteen or more CAN nodes on a network HDM can be used to configure DDP Series to use the rotary switch, or combinations of digital inputs and programmed offset in flash memory to configure the drive with a higher CAN node address. For more information on CANopen communications, download the CANopen Manual from the Harmonic Drive web-site: CANopen Manual

CANOPEN CONNECTORS

Dual RJ-45 connectors that accept standard Ethernet cables are provided for CAN bus connectivity. Pins are wired-through so that drives can be daisy-chained and controlled with a single connection to the user’s CAN interface. A CAN terminator should be placed in the last drive in the chain. The XTL-nK connector kit provides a D-Sub adapter that plugs into a CAN controller and has an RJ-45 socket that accepts the Ethernet cable.

ADP-nK CAN CONNECTOR KIT

The kit contains the XTL-CV adapter that converts the CAN interface D-Sub 9M connector to an RJ-45 Ethernet cable socket, plus a 10 ft (3 m) cable and terminator. Both connector pin-outs conform to the CiA DR-303-1 specification.

</table>

Note: Red & green led on-times do not overlap.
LED color may be red, green, off, or flashing of either color.

DEVICENET

DeviceNet operation is a communications protocol that uses the CAN bus for the hardware layer. It is employed by Allen-Bradley PLC’s and enables the DDP Series drives to be controlled directly from A-B PLC’s.

For more information on DeviceNet communications, download the DeviceNet FW & EDS files from the Harmonic Drive web-site: Device Firmware & EDS

This link is to a ZIP file that contains the DeviceNet Programmers guide and EDS files for Harmonic Drive motion products.
**DRIVE STATUS LED**

A single bi-color LED gives the state of the drive by changing color, and either blinking or remaining solid. The possible color and blink combinations are:

- **Green/Solid:** Drive OK and enabled. Will run in response to reference inputs or CANopen commands.
- **Green/Slow-Blinking:** Drive OK but NOT-enabled. Will run when enabled.
- **Green/Fast-Blinking:** Positive or Negative limit switch active. Drive will only move in direction not inhibited by limit switch.
- **Red/Solid:** Transient fault condition. Drive will resume operation when fault is removed.
- **Red/Blinking:** Latching fault. Operation will not resume until drive is Reset.

**Faults are programmable to be either transient or latching.**
DIGITAL SERVO DRIVE for BRUSHLESS or BRUSH MOTORS

DDP Series

COMMAND INPUTS

ANALOG REFERENCE INPUT
A single ±10 Vdc differential input takes inputs from controllers that use PID or similar compensators, and outputs a current command to the drive. Drive output current or velocity vs. reference input voltage is programmable.

DIGITAL POSITION
Digital position commands can be in either single-ended or differential format. Single-ended signals should be sourced from devices with active pull-up and pull-down to take advantage of the high-speed inputs. Differential inputs have 121 W line-terminators.

SINGLE ENDED PULSE & DIRECTION

DIRECTION

SINGLE ENDED CU/CD

CU (Count-Up)

CD (Count-Down)

DIFFERENTIAL 50% PWM

DUTY = 50% ±50%

DIFFERENTIAL NO FUNCTION

DUTY = 50% ±50%
**DIGITAL INPUTS**

DDP Series has twelve digital inputs, eleven of which have programmable functions. Input [IN1] is dedicated to the drive Enable function. This is done to prevent accidental programming of the input in such a way that the controller could not shut it down.

Two types of RC filters are used: GP (general purpose) and HS (high speed). Input functions such as Pulse/Dir, CW/CCW, Quad A/B are wired to inputs having the HS filters, and inputs with the GP filters are used for general purpose logic functions, limit switches, and the motor temperature sensor. Programmable functions of the digital inputs include:

- Positive Limit switch
- Negative Limit switch
- Home switch
- Drive Reset
- PWM current or velocity commands
- CAN address bits
- Step & Direction, or CU/CD
- step motor position commands
- Quad A/B master encoder position commands
- Motor over-temperature
- Motion Profile Abort

**PULL-UP/PULL-DOWN CONTROL**

In addition to the active level and function for each programmable input, the input resistors are programmable in four groups to either pull up to +5 Vdc, or down to ground. Grounded inputs with HI active levels interface to PLC’s that have PNP outputs that source current from +24 Vdc sources. Inputs pulled up to +5 Vdc work with open-collector, or NPN drivers that sink current to ground. The table below shows the PU/PD groups and the inputs they control.

DIGITAL SERVO DRIVE for BRUSHLESS or BRUSH MOTORS

DDP Series

DIGITAL OUTPUTS
The digital outputs are open-drain MOSFETs with 1 kΩ pull-up resistors in series with a diode to +5 Vdc. They can sink up to 1 Adc from external loads operating from power supplies to +30 Vdc. The output functions are programmable. The active state of the outputs is programmable to be on or off. When driving inductive loads such as a relay, an external fly-back diode is required. The internal diode in the output is for driving PLC inputs that are opto-isolated and connected to +24 Vdc. The diode prevents conduction from +24 Vdc through the 1 kΩ resistor to +5 Vdc in the drive. This could turn the PLC input on, giving a false indication of the drive output state.

MOTOR CONNECTIONS
Motor connections are of three types: phase, feedback, and thermal sensor. The phase connections carry the drive output currents that drive the motor to produce motion. A thermal sensor that indicates motor overtemperature is used to shut down the drive to protect the motor. Feedback can be digital quad A/B encoder, analog sin/cos encoder, resolver or digital Halls, depending on the version of the drive.

MOTOR PHASE CONNECTIONS
The drive output is a three-phase PWM inverter that converts the DC buss voltage (+HV) into three sinusoidal voltage waveforms that drive the motor phase-coils. Cable should be sized for the continuous current rating of the motor. Motor cabling should use twisted, shielded conductors for CE compliance, and to minimize PWM noise coupling into other circuits. The motor cable shield should connect to motor frame and the drive frame ground terminal (J2-1) for best results.

DIGITAL HALL SIGNALS
Hall signals are single-ended signals that provide absolute feedback within one electrical cycle of the motor. There are three of them (U, V, & W) and they may be sourced by magnetic sensors in the motor, or by encoders that have Hall tracks as part of the encoder disc. They typically operate at much lower frequencies than the motor encoder signals, and are used for commutation-initialization after startup, and for checking the motor phasing after the amplifier has switched to sinusoidal commutation.

DIGITAL ENCODERS
The quad A/B encoder interface is a differential line-receiver with R-C filtering on the inputs. Encoders with differential outputs are required because they are less susceptible to noise that can degrade single-ended outputs. Encoder cables should use twisted-pairs for each signal pair: A & /A, B & /B, X & /X. An overall shield should be used, and for longer cables, shields for individual pairs may be necessary to guarantee signal integrity.

ANALOG ENCODER (-S MODELS)
DDP Series supports analog encoder signals for position feedback. The Sin and Cos inputs are differential with 121 Ω terminating resistors and accept 1.0 Vp-p signals in the A/B format used by encoders with analog outputs such as Heidenhain, Stegman, and Renishaw. When HD’s ServoTube motors are used the analog encoder supplies both commutation and incremental position feedback.

RESOLVER (-R MODELS)
Connections to the resolver should be made with shielded cable that uses three twisted-pairs. Once connected, resolver set up, motor phasing, and other commissioning adjustments are made with CME 2 software. There are no hardware adjustments.

MOTOR TEMPERATURE SENSOR
Digital input [In5] is for use with a motor overtemperature switch. The input should be programmed as a pull-up to +5 Vdc if the motor switch is grounded when cold, and open or high-impedance when over-heating.

MULTI-MODE ENCODER PORT

This port consists of three differential input/output channels that take their functions from the Basic Setup of the drive. On drives with quad A/B encoder feedback, the port works as an output buffering the signals from the encoder. With resolver or sin/cos encoder versions, the feedback is converted to quad A/B signals with programmable resolution. These signals can then be fed back to an external motion controller that closes the position or velocity loops. As an input, the port can take quad A/B signals to produce a dual-loop position control system or use the signals as master-encoder feedback in camming mode. In addition, the port can take stepper command signals (CU/CD or Pulse/Direction) in differential format.

AS BUFFERED OUTPUTS FROM A DIGITAL QUADRATURE FEEDBACK ENCODER

When using a digital quadrature feedback encoder, the A/B/X signals drive the multi-mode port output buffers directly. This is useful in systems that use external controllers that also need the motor feedback encoder signals because these now come from J7, the Control connector. In addition to eliminating "Y" cabling where the motor feedback cable has to split to connect to both controllers and motor, the buffered outputs reduce loading on the feedback cable that could occur if the motor encoder had to drive two differential inputs in parallel, each with its own 121 ohm terminating resistor.

AS EMULATED QUAD A/B/X ENCODER OUTPUTS FROM AN ANALOG SIN/COS FEEDBACK ENCODER

Analog sin/cos signals are interpolated in the drive with programmable resolution. The incremental position data is then converted back into digital quadrature format which drives the multi-mode port output buffers. Some analog encoders also produce a digital index pulse which is connected directly to the port’s output buffer. The result is digital quadrature A/B/X signals that can be used as feedback to an external control system.

AS A MASTER OR CAMMING ENCODER INPUT FROM A DIGITAL QUADRATURE ENCODER

When operating in position mode the multi-mode port can accept digital command signals from external encoders. These can be used to drive cam tables, or as master-encoder signals when operating in a master/slave configuration.

AS DIGITAL COMMAND INPUTS IN PULSE/DIRECTION, PULSE-UP/PULSE-DOWN, OR DIGITAL QUADRATURE ENCODER FORMAT

The multi-mode port can also be used when digital command signals are in a differential format. These are the signals that typically go to [IN9] and [IN10] when they are single-ended. But, at higher frequencies these are likely to be differential signals in which case the multi-mode port can be used.

GROUNDING CONSIDERATIONS

Power and control circuits in DDP Series share a common circuit-ground (Gnd on J1-4, and Signal Ground on J2-2, 10, 15, 20, and J3-2, 23). Input logic circuits are referenced to Signal Ground, as are analog Reference inputs, digital outputs, encoder and Hall signals. For this reason, drive Gnd terminals should connect to the users’ common ground system so that signals between drive and controller are at the same common potential, and to minimize noise. The system ground should, in turn, connect to an earthing conductor at some point so that the whole system is referenced to “earth”. The CAN ports are optically isolated from the drive circuits.

Because current flow through conductors produces voltage-drops across them, it is best to connect the drive HV Return to system earth, or circuit-common through the shortest path, and to leave the power-supply floating. In this way, the power supply (+) terminal connects to ground at the drive HV Return terminals, but the voltage drops across the cables will not appear at the drive ground, but at the power supply negative terminal where they will have less effect.

Motor phase currents are balanced, but currents can flow between the PWM outputs, and the motor cable shield. To minimize the effects of these currents on nearby circuits, the cable shield should connect to Gnd (J1-4).

The drive case does not connect to any drive circuits. Connections to the case are provided on connectors J2-1, and J3-1. Cables to these connectors should be shielded for CE compliance, and the shields should connect to these terminals. When installed, the drive case should connect to the system chassis. This maximizes the shielding effect of the case, and provides a path to ground for noise currents that may occur in the cable shields.

Signals from controller to drive are referenced to +5 Vdc, and other power supplies in user equipment. These power supplies should also connect to system ground and earth at some point so that they are at same potential as the drive circuits.

The final configuration should embody three current-carrying loops. First, the power supply currents flowing into and out of the drive at the +HV and Gnd pins on J1. Second the drive outputs driving currents into and out of the motor phases, and motor shield currents circulating between the U, V, and W outputs and Gnd. And, lastly, logic and signal currents connected to the drive control inputs and outputs.

For CE compliance and operator safety, the drive should be earthed by using external tooth lockwashers under the mounting screws. These will make contact with the aluminum chassis through the anodized finish to connect the chassis to the equipment frame ground.

POWER SUPPLIES

DDP Series operates typically from transformer-isolated, unregulated DC power supplies. These should be sized such that the maximum output voltage under high-line and no-load conditions does not exceed the drives maximum voltage rating. Power supply rating depends on the power delivered to the load by the drive. In many cases, the continuous power output of the drive is considerably higher than the actual power required by an incremental motion application.

Operation from regulated switching power supplies is possible if a diode is placed between the power supply and drive to prevent regenerative energy from reaching the output of the supply. If this is done, there must be external capacitance between the diode and drive.

AUXILIARY HV POWER

DDP Series has an input for AUX-HV. This is a voltage that can keep the drive communications and feedback circuits active when the PWM output stage has been disabled by removing the main +HV supply. This can occur during EMO (Emergency Off) conditions where the +HV supply must be removed from the drive and powered-down to ensure operator safety. The AUX HV input operates from any DC voltage that is within the operating voltage range of the drive and powers the DC/DC converter that supplies operating voltages to the drive DSP and control circuits.

When the drive +HV voltage is greater than the AUX-HV voltage it will power the DC/DC converter. Under these conditions the AUX-HV input will draw no current.

MOUNTING & COOLING

DDP Series has slots for mounting to panels at 0° or 90°. Cooling is by conduction from drive heatplate to mounting surface, or by convection to ambient.

A heatsink (optional) is required for the drive to deliver the rated continuous output current. Depending on the drive mounting and cooling means this may not be required.
GROUNDING & SHIELDING FOR CE

Grounding and shielding are the means of controlling the emission of radio frequency energy from the drive so that it does not interfere with other electronic equipment. The use of shielded cables to connect the drive to motors and feedback devices is a way of extending the chassis of the drive out to these devices so that the conductors carrying noise generated by the drive are completely enclosed by a conductive shield.

The process begins at the connector J1 of the drive. When possible, it is best to ground the (-) HV terminal to the equipment earth ground with as short a connection as possible. The drives’ PWM outputs produce current pulses in the wires between drive and power supply. By grounding the power supply at the drive end of the cables, this noise will not appear between earth ground and drive circuit ground. And, using shielded cable between drive and power supply will provide a return path for noise produced in the cables that might otherwise radiate to adjacent equipment.

The shield of the motor cable should also connect to either J1-4, or to a nearby star ground at the chassis where the power-supply (-) terminal connects. Connecting the shields of the motor cable to the motor frame completes the return path for noise that is capacitively coupled to the motor frame.

Next, ground the motor heatplate using an external-tooth locking washer. This will penetrate the anodized finish of the heatplate (which is an electrical insulator) and make good electrical contact with the aluminum plate. Grounding the heatplate in this way shortens the path from drive to earth ground and further reduces emissions.

Shield should also be added to the cables from the motion controller or control system, and from the feedback device on the motor.

Notes:
1) Shielded cables required for CE are shown in the diagram above.

DIGITAL SERVO DRIVE for BRUSHLESS or BRUSH MOTORS

**DDP Series**

**STAND-ALONE CONFIGURATION**

**SERIAL CABLE KIT**

- SER-CK

**+HV/MOTOR FEEDBACK AND CONTROL CONNECTOR KIT**

- ADP-CK

**POWER SUPPLY**

- +HV
  - Mains-isolated DC
  - Required for all systems
  - User-supplied

**HEATSINK**

- DDP-HK
  - (Optional)

**Current or Velocity Mode Signals:**
- PWM & Polarity
- PWM 50%
- ±10V Analog

**Position-mode Signals:**
- Step/Direction
- CW/CCW
- ±10V Analog

**Electronic Gearing Signals:**
- A/B Quadrature encoder

HDM is used for setup and configuration.

Page 21 of 24
POWER DISSIPATION

The charts on this page show the drive internal power dissipation for the DDP Series models under differing power supply and output current conditions. Drive output current is calculated from the motion profile, motor, and load conditions. The values on the chart represent the RMS (root-mean-square) current that the drive would provide during operation. The +HV values are for the average DC voltage of the drive power supply.

When +HV and drive output current are known, the drive power dissipation can be found from the chart. Once this is done use the data on the facing page to find drive thermal resistance. From this calculate the maximum ambient operating temperature. If this result is lower than the known maximum ambient temperature then a mounting with a lower thermal resistance must be used.

When the drive is disabled the power dissipation is shown on the chart as “Off”. Note that this is a different value than that of an drive that is “On” but outputting 0 A current.

### 55 & 90 VDC MODELS

**DDP-180-18**

**DDP-180-09**
MOUNTING

Thermal data for convection-cooling with a heatsink assumes a vertical mounting of the drive on a thermally conducting surface. Heatsink fins run parallel to the long axis of the drive. When fan-cooling is used vertical mounting is not necessary to guarantee thermal performance of the heatsink.

THERMAL RESISTANCE

Thermal resistance is a measure of the temperature rise of the drive heatplate due to power dissipation in the drive. It is expressed in units of °C/W where the degrees are the temperature rise above ambient.

E.g., an drive dissipating 16 W mounted with no heatsink or fan would see a temperature rise of 46 °C above ambient based on the thermal resistance of 2.9 °C/W. Using the drive maximum heatplate temperature of 70 °C and subtracting 46 °C from that would give 24 °C as the maximum ambient temperature the drive in which the amplifier could operate before going into thermal shutdown. To operate at higher ambient temperatures a heatsink or forced-air would be required.
